3-(4-BENZYLOXYPHENYL)PROPANOIC ACID DERIVATIVES

Technical Field

The present invention relates to a novel compound having
5 GPR40 receptor function modifying action and which is useful as
an agent for the prophylaxis or treatment of diabetes.

Background Art

It has been reported in recent years that a ligand of
GPR40, which is one of the G Protein-Coupled Receptors (GPCR),
10 is fatty acid and GPR40 in pancreatic β cell is deeply involved
in insulin secretion action (Nature, 2003, vol. 422, pages 173-

antagonist inhibits insulin secretion, and the agonist and the
antagonist are useful as an agent for the prophylaxis or
15 treatment of type 2 diabetes, obesity, impaired glucose
tolerance, insulin resistance, neurodegenerative diseases
(Alzheimer's disease) and the like (WO03/068959 and WO02/057783).

For diagnostic criteria of diabetes, Japan Diabetes Society reported new diagnostic criteria in 1999.

According to this report, diabetes is a condition showing any of a fasting blood glucose level (glucose concentration of intravenous plasma) of not less than 126 mg/dl, a 75 g oral glucose tolerance test (75 g OGTT) 2 h level (glucose concentration of intravenous plasma) of not less than 200 mg/dl, and a non-fasting blood glucose level (glucose concentration of intravenous plasma) of not less than 200 mg/dl. A condition not falling under the above-mentioned diabetes and different from "a condition showing a fasting blood glucose level (glucose concentration of intravenous plasma) of less than 110 mg/dl or a 75 g oral glucose tolerance test (75 g OGTT) 2 h level (glucose concentration of intravenous plasma) of less than 140 mg/dl" (normal type) is called a "borderline type".

In addition, ADA (American Diabetes Association) reported new diagnostic criteria of diabetes in 1997 and WHO in 1998.

According to these reports, diabetes is a condition showing a fasting blood glucose level (glucose concentration of intravenous plasma) of not less than 126 mg/dl and a 75 g oral glucose tolerance test 2 h level (glucose concentration of intravenous plasma) of not less than 200 mg/dl.

According to the above-mentioned reports, impaired glucose tolerance is a condition showing a fasting blood glucose level (glucose concentration of intravenous plasma) of less than 126 mg/dl and a 75 g oral glucose tolerance test 2 h level (glucose

concentration of intravenous plasma) of not less than 140 mg/dl and less than 200 mg/dl. According to the report of ADA, a condition showing a fasting blood glucose level (glucose concentration of intravenous plasma) of not less than 110 mg/dl and less than 126 mg/dl is called IFG (Impaired Fasting Glucose). According to the report of WHO, among the IFG (Impaired Fasting Glucose), a condition showing a 75 g oral glucose tolerance test 2 h level (glucose concentration of intravenous plasma) of less than 140 mg/dl is called IFG (Impaired Fasting Glycemia).

Experimental Example 1

20 Determination of EC_{50} of the compound of the present invention
against human GPR40

For determination of EC_{50} , CHO cell line that stably
expressed human GPR40 was used. Unless otherwise indicated, the
CHO cell line was cultured using α -MEM medium (Invitrogen)
25 containing 10% fetal calf serum (Invitrogen).

The cells cultured to nearly confluent were rinsed with
PBS (Invitrogen) on the previous day of the assay, peeled off
with 0.05% Trypsin-EDTA solution (Invitrogen) and recovered by
centrifugation. The number of the obtained cells was counted,
30 and the cells were diluted such that 3×10^5 cells were contained
per 1 mL of the medium, dispensed to a black welled 96-well
plate (coster) by 100 μ L per well and cultured overnight in a CO_2
incubator. Various test compounds were added to the CHO cells
thus prepared, and the changes in the intracellular calcium

concentration was measured using FLIPR (Molecular Device). The below-mentioned pre-treatment was applied to measure changes in the intracellular calcium concentration by FLIPR.

An assay buffer for adding a fluorescence dye Fluo3-AM (DOJIN) to the cells, or for washing the cells immediately before FLIPR assay was prepared. To a solution of 1M HEPES (pH 7.4, DOJIN, 20 mL) added to HBSS (Invitrogen, 1000 mL) (hereinafter HBSS/HEPES solution) was added a solution (10 mL) obtained by dissolving probenecid (Sigma, 710 mg) in 1N NaOH (5 mL), and adding and mixing an HBSS/HEPES solution (5 mL), and the resulting solution was used as an assay buffer. Fluo3-AM (50 µg) was dissolved in dimethylsulfoxide (Wako, 21 µL), and an equivalent amount of 20% pluronic acid (Molecular Probes) was added and mixed. The solution was added to the assay buffer (10.6 mL) supplemented with fetal calf serum (105 µL) to give a fluorescence dye solution. On the previous day of assay, the medium of the CHO cells newly inoculated to the black wellled 96-well plate was removed, the fluorescence dye solution was immediately dispensed by 100 µL per well and the cells were cultured in a CO₂ incubator for 1 hr to allow intake of the fluorescence dye by the cells. The cells after the culture were washed with the above-mentioned assay buffer and set on FLIPR. The test compound was diluted with dimethylsulfoxide in advance, dispensed to polypropylene 96-well plate (sample plate) by 2 µL, and cryopreserved at -20°C. To the thawed sample plate was added an assay buffer containing 0.015% CHAPS (DOJIN) by 198 µL, and simultaneously set on FLIPR together with the cell plate. After the aforementioned pre-treatment, changes in the intracellular calcium concentration upon addition of various test compounds was measured by FLIPR. Based on the results, a dose-response curve of each test compound was formed and EC₅₀ was calculated. The results are shown in Table 1.
